

WILD

ADDITIVE MANUFACTURING

start the process

**WILD HAS BEEN DEVELOPING AND PRODUCING GENERATIVE
MANUFACTURING SYSTEMS FOR OVER SIX YEARS.**

Thus, additive manufacturing is no longer just a vision but already a mastered technology for the systems partner.

What has WILD specialised in the area of additive manufacturing?

We focus on the development and production of complex devices and systems, some of which employ laser procedures. In these areas, we are able to fully exploit our longstanding optomechatronics expertise and our comprehensive skills as a serial manufacturer. This includes, amongst other, our know-how in the areas of high precision, casing technology, free-form optics, surface engineering, software and digital imaging.

When is WILD the right partner for me?

As a systems partner, we work both for international market leaders and start-ups. Whether you are currently developing your first ideas or you are already in transition to serial production, you will benefit from the WILD Group's know-how at any point. We cover everything from individual engineering packages including the development of new features such as, e.g. more precise laser optics, multiple laser systems or in-process control systems, to the mechanical production and assembly of complete devices.

The quantities we produce are variable and may be limited to a few units for prototypes or, if necessary, be flexibly upscaled to thousands of units.

Can WILD manufacture devices for different printing processes?

Yes, absolutely. We are flexible and master different techniques such as selective laser sintering, stereo lithography systems, FDM machines and more. Whether industrial printers for production halls or desktop devices for prototype workshops, WILD can implement all requirements in manufacturing. The necessary production environment is available. For sensitive scanning units, we produce in separate flow boxes or in a cleanroom environment. Customers benefit particularly from our expertise in optomechatronic assemblies, such as, for example SLS laser scanners.
